Facts & Figures

The 2011 Annual Report on Disability in New Hampshire

Introduction

Information drives change. Statistics are a powerful form of information used in policymaking, program evaluation, research, and advocacy. Statistics are frequently used to frame the issues, monitor current circumstances and progress, judge the effectiveness of policies and programs, make projections about the future, and predict the costs of potential policy changes. They are particularly powerful when they address the specific populations in question. For instance, the great benefit of the decennial census is its ability to provide very local information.

Statistics about the population with disabilities and about the government programs that serve people with disabilities—disability statistics—are often difficult to find. Numerous government agencies generate and publish disability statistics, and as a result, disability statistics are scattered and buried in documents and websites all across the federal and state governments.

Facts & Figures is a new annual publication of the Institute on Disability (IOD) at the University of New Hampshire focusing on the population with disabilities in New Hampshire, with comparisons to neighboring states and the nation. Together, *Facts & Figures*, the IOD's *To The Point: An Introduction to Disability in the Granite State* (www.iod.unh.edu), and the *Annual Disability Statistics Compendium* (www.disabilitycompendium.org) are intended to provide a comprehensive picture of important issues related to disability.

Topics

While there are many issues which impact the disability community in New Hampshire, *Facts & Figures* focuses on four key topic areas: demographics, education, economic well-being, and participation in government programs. Demographic statistics provide a basic framing of the size and composition of the population with disabilities in New Hampshire. The education section explores the presence of students with disabilities in a regular classroom setting. Statistics on economic well-being focus on employment and poverty, while government program statistics focus on participation in specific programs as well as costs. In future years, we hope to expand to new topics, such as health behaviors and access.

Layout

For each of these four topics, *Facts & Figures* (a) provides a brief discussion of the topic, (b) highlights a relevant statistic with a figure, and (c) presents a table with additional statistics.

Data Sources

The statistics in *Facts & Figures* are primarily drawn from the *Annual Disability Statistics Compendium*, which in turn draws from the Census Bureau's 2009 American Community Survey (ACS), as well as administrative reports from government agencies, such as the Social Security Administration. The bottom of each table provides documentation on the *Compendium* tables from which the statistics are drawn and other relevant sources.

Additional Resources

Facts & Figures is designed to serve as a reference guide to government publications. These referenced sources contain additional statistics, as well as information about the way the data were collected and generated. Assistance in interpreting and locating additional statistics is available via our toll-free number, 866-538-9521.

The *Annual Disability Statistics Compendium* may be found at www.DisabilityCompendium.org. The *Compendium* contains a more comprehensive set of statistics related to disability.

Population Statistics

Population Size

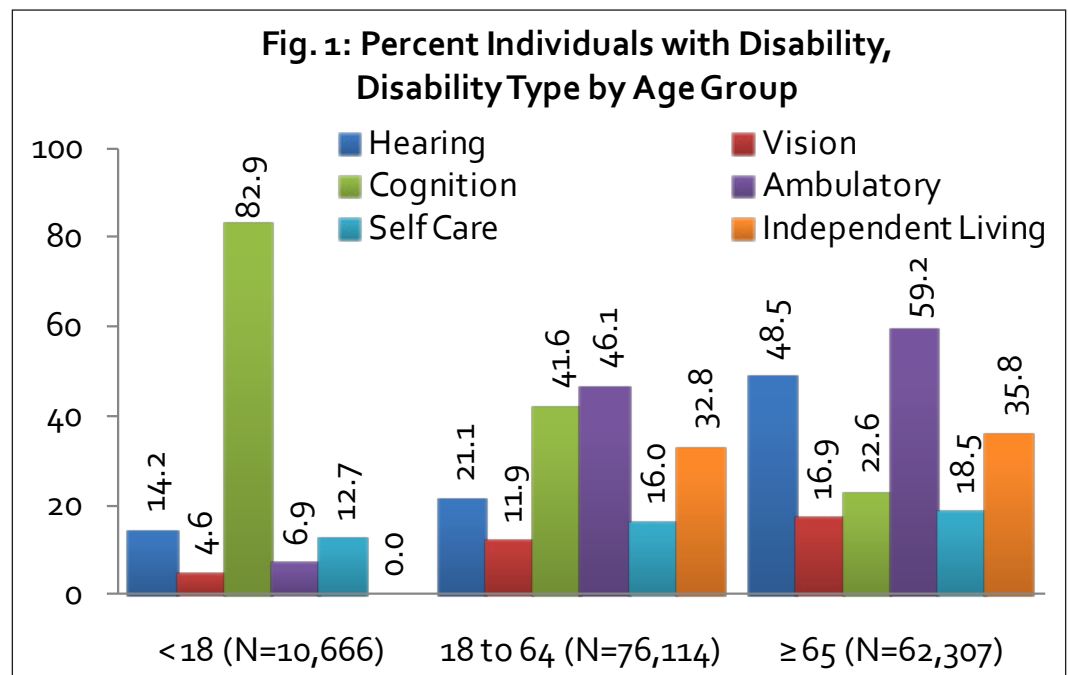

Understanding the size and diversity of the population with disabilities is critically important. Population statistics are an important foundation for such understanding. For instance, they provide insight into the allocation and types of services needed to ensure equal opportunities for people with disabilities. According to estimates from the U.S. Census Bureau's 2009 American Community Survey (ACS), among the estimated 1,308,729 New Hampshire individuals living in the community, an estimated 149,087 (or 11.4%) reported having one or more disabilities (this does not include people living in institutions or individuals in the Armed Forces, for which statistics are currently unavailable). The percentage of individuals with disabilities in New Hampshire is smaller than the percentage of individuals with disabilities in Vermont (13.6%) and Maine (16.1%) and larger than the percentage of individuals with disabilities in Massachusetts (11.2%).

Age and Disability

The percentage of people reporting disability (i.e., the prevalence of disability) varies across age groups—typically increasing with age. In New Hampshire, in 2009, the prevalence of disability was 4% for individuals under 18 years old, 9% for individuals ages 18 to 64, and 37% for individuals 65 years and over.

Disability Type

The population with disabilities is highly diverse with respect to the type of disability, and this diversity varies with age. Figure 1 depicts the distribution of disability type in New Hampshire for three age groups.ⁱ Among individuals with disabilities under 18 years old, individuals with cognitive disabilities are the largest group (83%). Among individuals ages 18 to 64 with disabilities, individuals with ambulatory (i.e., mobility) disabilities are the largest group (46%) followed by individuals with cognitive disabilities (42%). Among individuals 65 years and over, individuals with ambulatory disabilities are the largest group (59%) followed by individuals with hearing disabilities (49%).

Additional Statistics

Table 1 provides additional population statistics on people with disabilities in neighboring states and the United States as a whole. The “Highest” column provides information on the state with the highest number or percentage of people within a particular category.

Table 1: Population Statistics**

†Does not include individuals living in institutions or individuals in the Armed Forces.

Employment Statistics

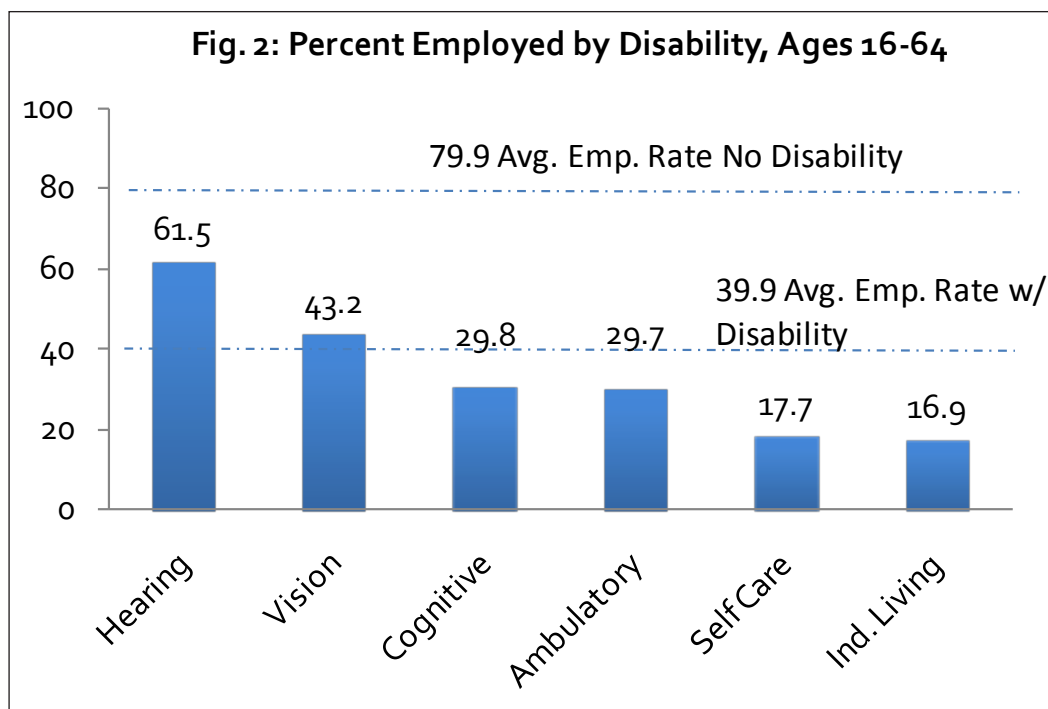

Employment

For many people with and without disabilities, engagement in the workforce is an important part of a fulfilling and valued life, providing opportunities for self-esteem development, autonomy, social contact, income, structured activity, and life satisfaction (Hergenrather, et al., 2003; Eklund, Hansson, & Ahlquist, 2004). Having a job has also been tied to better health, a longer life, and greater satisfaction with life for people with disabilities. And, of course, employment in a good paying job reduces the likelihood that an individual lives below the poverty line.

According to estimates from 2009, among the 448,011 New Hampshire civilians with disabilities ages 18 to 64 living in the community, 30,354 (39.9%) were employed. By comparison, of the 774,654 New Hampshire civilians without disabilities ages 18 to 64 living in the community, 619,284 (79.9%) were employed, for a difference (a.k.a., employment gap) of 40 percentage points.

Disability Type

Figure 2 shows that employment rates in New Hampshire vary considerably based on the type of disability, with the highest employment rate among individuals with hearing disabilities (61.5%) followed by individuals with vision disabilities (43.2%) and the lowest employment rate among individuals with independent living disabilities (16.9%). The employment rates among individuals with cognitive disabilities and individuals with ambulatory disabilities are quite similar: 29.8% and 29.7%, respectively. Similar patterns are seen in Vermont, Maine, Massachusetts, and nationally.

Additional Statistics

On the following page, Table 2 provides additional New England and U.S. statistics on a range of employment indicators, including the number employed, employment rates, percentage employed full-time/full-year, median earnings, and poverty. The “Highest” column provides information on the state with the highest number or percentage of people within a particular category, with the exception of poverty indicators, for which the lowest values are used.

Education Statistics

Educational Attainment

As employment is to adults, education is to youth and young adults. It is an important social role and opens opportunities now and in the future. According to estimates from 2009, among the 76,114 New Hampshire civilians with disabilities ages 18 to 64 living in the community, 22.8% had at least a two-year college degree. By comparison, of the 774,654 New Hampshire civilians without disabilities ages 18 to 64 living in the community, 47.7% had at least a two-year college degree.

Inclusion

To promote educational opportunities available to students with disabilities, inclusive education calls for students with and without disabilities to be taught in the same setting. Spending more time in general education classrooms fosters better attendance, as well as greater engagement, achievement, and social adjustment of students with disabilities at school (Blackorby, et al., 2007; Wagner, et al., 2006).

Based on data from the U.S. Department of Education, Figure 3 provides the percent of individuals with different types of disability who are included in the regular classroom at least 80% of the day. In New Hampshire, only one in ten of those with multiple disabilities or mental retardation are included this often, one in three of those with autism or emotional disturbance, and about one in two (or less) of individuals with other disability types. In general, New Hampshire rates are substantially below the U.S. average across all categories (43% for New Hampshire vs. a 58% inclusion rate for the United States) as well as for each disability type tracked.

Additional Statistics

On the following page, Table 3 provides additional New England and U.S. data on the indicators described above. The “Highest” column provides information on the state with the highest number or percentage of people within a particular category.

Table 3: Education Statistics

Program Statistics

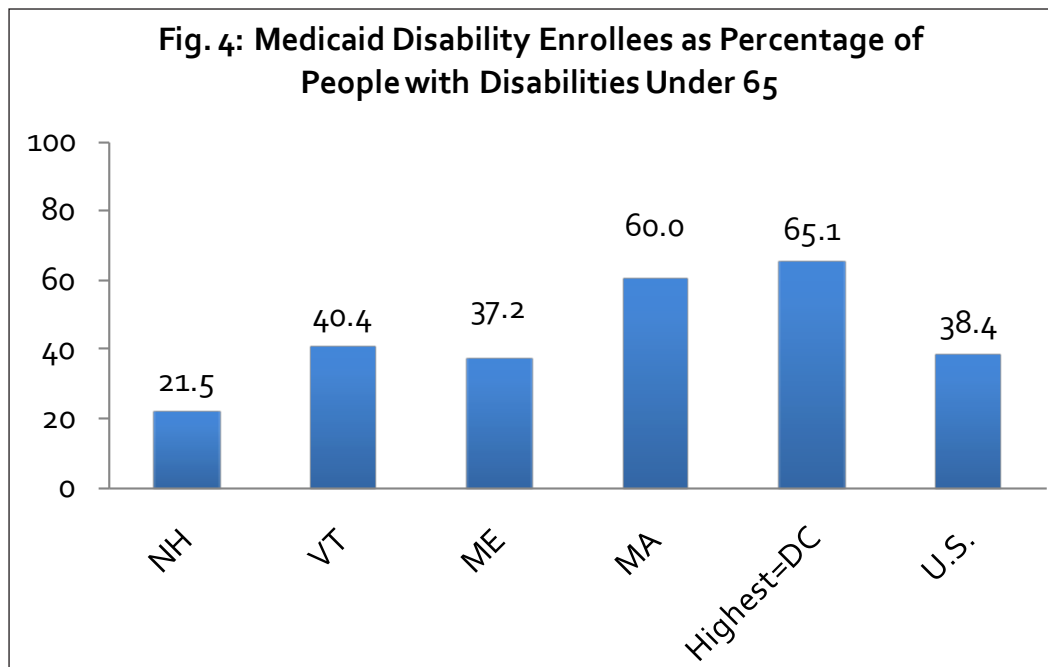

Program Participation

There are a number of programs that provide support and services on the basis of having a disability, including the Medicaidⁱⁱ and Medicareⁱⁱⁱ programs (providing health insurance), Social Security Disability Insurance^{iv} (SSDI) and Supplemental Security Income^v (SSI) (providing income support), and vocational rehabilitation^{vi} (providing job placement and training).

Medicaid

According to testimony before the U.S. House of Representatives, Diane Rowland of the Kaiser Family Foundation noted, “Medicaid plays a critical role in providing health care services to people with disabilities” (2008). In federal fiscal year 2007 (Oct. 2007-Sept. 2008), 56.8 million low-income children, working-age adults, people with disabilities, and elderly received health insurance and long-term care assistance from the Medicaid program. In New Hampshire, 126,074 individuals were enrolled in Medicaid, and 14.8% (18,698 individuals) received Medicaid on the basis of disability, which percentage-wise was the same as in the United States as a whole.

With respect to the size of the population, the number of disability-related Medicaid enrollees as a percentage of people with disabilities ages under 65 years is far lower in New Hampshire (21.5%) than in Vermont (40.4%), Maine (37.2%), Massachusetts (60.0%), and nationally (38.4%); see Figure 4.

Additional Statistics

On the following page, Table 4 provides additional New England and U.S. statistics for other programs, including Medicare, SSDI, SSI, and vocational rehabilitation. The “Highest” column provides information on the state with the highest number or percentage of people within a particular category.

Table 4: Program Statistics*

Endnotes

- ⁱ It is possible for an individual to report more than one disability, thus the percentages do not necessarily add up to 100%.
- ⁱⁱ To be covered by Medicaid, individuals must meet both income and asset requirements and fall into one of the eligibility categories (including age, pregnancy, disability, and blindness).
- ⁱⁱⁱ Medicare provides health insurance coverage to people 65 and over as well as those meeting special criteria.
- ^{iv} SSDI provides income supplements to individuals who are restricted in their ability to be employed because of a disability.
- ^v SSI provides stipends for individuals with low income, aged 65 or older, blind, or disabled meeting the income eligibility criteria.
- ^{vi} Vocational rehabilitation programs provide rehabilitation services to citizens with disabilities to help them secure suitable employment and financial and personal independence.
